

IF YOU HAVE QUESTIONS OR CONCERNS, CALL (855) 863-9595 TO SPEAK WITH OUR ON-CALL CLINICIAN.

### WHAT IS IT?

A kenalog injection is a steroid used to help soften and smooth your hypertrophic (thick and/or raised) burn scar. Injections are typically required over multiple visits.

### WHAT TO EXPECT

Kenalog injections may cause itching at the injection site. If itching occurs, you may use over-the-counter oral medication.

### CARE FOR INJECTED SITE

Use antibiotic ointment on the injection site as directed. Use 2-3 times daily for 2-3 days. If you are wearing pressure garments, use ointment and a non-stick pad, such as a Telfa pad, under your garments. You may resume wearing your compression garments 24 hours after the injections.
